Mungo Design software ready for download!

A lot has changed since our first FixCalc software. Not only did we change the entire user interface, making it a delight to use. We also changed the engine, allowing you to calculate flexible embedment depths, optimal slab sizes, multiple baseplate types, etc.

A single program window in which all of the information necessary for the calculation can be entered or selected allows the user to keep a focus on his project.

The advantages of our new Mungo Design software at a glance

- User-friendly interface
- Optional user prompting and helpful reminders for missing information serve to reduce familiarisation time to a minimum
- The data can be edited either directly in the graphic or in the provided data fields
- Easy switching between a 2D and 3D view of the graphic
- Contact details of companies can be saved to enable these to be used again in subsequent projects
- The design printout can optionally be enlarged with additional documents
- Online updates: a download of the entire installation package is not necessary when enhancements are released
- Professional calculation printouts showing calculation parameters used
